

TSA
APPROVED

SPECTRUM 180180 DV

It is with great satisfaction and aware of all the dedication that was required, that we communicated that the Spectrum 180180 DV also obtained the approval of the USA agency TSA. Thus, from now on, it is accredited that the equipment meets all the requirements required for commercialization in the United States and in several other countries around the world.

This is another important step towards the internationalization of our operations. A path that we have been walking for some time, with solid and structured actions that pave a trajectory of successive achievements.

And it is precisely at this moment, when we reap the fruits of long work, that we consider it essential to look at all who have always dedicated themselves and been available to face obstacles. After all, success is made of the union of a real team in action.

Our recognition and gratitude to each one of you who has made our achievements possible over these three decades. Especially to the group of professionals who made this achievement a reality.

Now it is time to renew our motivations to continue building the history of this company that, over another 30 years of existence, has become one of the largest in the sector in the world. We're counting on you!

About TSA

The Transportation Security Administration (TSA) is a USA agency that aims to oversee and strengthen the USA air transportation security system.

The TSA is the body responsible for all means of transport but acts in the field of aviation in checking the luggage, as well as determining the requirements of the equipment, devices and solutions used in this task. The certification is also adopted by several other countries around the globe.
